

## 4. The Taurus Bonus

---

Our development work will not stop here.

We aim to demonstrate that the ethanol production can be increased with up to 40% in fermentation of hexoses and pentoses in pentose rich hydrolysates compared to fermentation with only hexoses. Our unique SSF-technology also offers higher efficiency at lower capital investment and processing costs.

We are continuing to refine our many patented yeast strains to accommodate all types of cellulose renewable feed-stock options and make them available through license agreements worldwide.

Welcome onboard to the Fuel of the Future!
